Abstract
The Emerald Network of Europe is analogous to the Natura 2000 network and is being developed in non-EU countries. As a result of three years work by the Ukrainian Nature Conservation Group, 106 new Emerald sites were added to the Emerald Network of Ukraine in December 2019, which affords adequate protection for 730,000 hectares of grasslands. This has addressed a significant shortcoming of the previous version of the network, which predominantly comprised existing nature conservation areas - reserves and national parks and in which forest and water habitats prevailed. Of the newly designated sites, 86 include different types of grassland habitats covering 12 types from Resolution 4 of the Bern Convention: 11 from group E (E1.11, E1.13, E1.2, E1.7 1, E1.9, E2.2, E2.3, E3.4, E3.5 E5.4, E6.2) and a complex type (X36) dominated by herbaceous vegetation. The most common type among them is E1.2 - Perennial calcareous grassland and basic steppes, which is represented in 63 (73.3%) of the newly designated sites. The most valuable sites are those created to protect habitat types included in Resolution 4 by proposals from Ukraine, namely E1.13 - Continental dry rocky steppic grasslands and dwarf scrub on chalk outcrops, and X36 – Depressions (pody) of the Steppe zone.

Keywords: Berne Convention; chalk outcrop; conservation; Emerald Network; grassland; habitat; “pody”; steppe.

Submitted: 11 January 2020; first decision 12 January 2020; accepted: 15 January 2020

Introduction
The Emerald Network is a network of nature conservation areas important for the protection of species and habitats in need of conservation throughout Europe. The network is analogous to the Natura 2000 network of the European Union. During a meeting of the Standing Committee of the Berne Convention, held in Strasbourg on 3-6 December, 2019, Ukraine’s proposal to include 106 new sites (including 730,000 hectares of grasslands, see Table 1) into the Emerald Network was accepted (Council of Europe 2019a). Upon Ukraine’s accession to the EU, these territories would be automatically included in the Natura 2000 network.

The decision to include these new areas (a total of 1,600,000 hectares) was taken at the request of Ukraine and was the result of work by experts of the NGO Ukrainian Nature Conservation Group. The Group was formally established in early 2018 to bring together biodiversity experts, develop a network of conservation areas, and implement best environmental law practices in Ukraine. Thus, the development of new Emerald Network sites became a major focus of collaboration for members of the organisation.

Outcomes
For about three years, 20 members of the Group and 40 other biologists who wished to join this initiative prepared justifications for the designation of new Emerald sites. Thanks to the support of the Ministry of Ecology and Natural Resources, in 2018 one of the members of the organisation, Oleksiy Marushchak, was trained to work with the Emerald Network database and to prepare reports together with the Ministry’s representative Anastasia Drapaluk. The training was provided by the Standing Committee of the Berne Convention. This enabled us to directly prepare standard data forms (SDFs) for the proposed Emerald sites. Following approval in principle and review, the proposals we prepared for 106 new Emerald sites were submitted by the Ministry for consideration by the Convention. All of the sites were incorporated into the Emerald Network on 4 December, 2019. In 2017-2018, thanks to the support of our Polish colleagues, the Natural Heritage Foundation, we were able to organise a series of training courses (covering 400 scientists and 400 students in 12 cities) and webinars. In addition, we published a series of Emerald Network devel-
The preliminary list of Emerald sites for Ukraine was adopted in 2016 (Council of Europe 2018) and at that time it mainly comprised all existing nature reserves and national nature parks. The total area of the network then was 5.8 million hectares (9% of the land area of Ukraine), but this did not produce significant additional conservation benefits, as 3.6 million hectares (5.7% of the land area of Ukraine, or 57% of the total area of Emerald sites in Ukraine) were territories that were already protected. Another 1% of the area of Ukraine (or 10% of the network area) consisted of the reservoirs of the Dnieper cascade, which play an important role as a migratory route for migratory birds. However, the open water surface of the reservoirs is little used by birds, so their inclusion in the Emerald Network hardly had a significant effect. Therefore, only 33% of the Emerald Network in Ukraine (2.5% of Ukraine’s area) in 2016 became territories for which inclusion in the network marked a real change by obtaining conservation status.

Moreover, almost all Emerald sites, until recently, were chiefly represented by forest habitats. Thus, the network was rather unrepresentative. On the other hand, almost all forests in Ukraine which are part of national parks or reserves are among the best preserved forests, since Ukrainian legislation restricts or prohibits felling in protected areas. Thus, the first version of the Emerald Network included most of Ukraine’s truly valuable forests.

Our work was primarily focused on identification of valuable natural areas that were characterised either by the uniqueness of species and habitats, or had a large number of species and habitats listed in the Berne Convention resolutions. Particular attention was paid to grassland habitats, as they were very poorly represented in the network because in Ukraine, apart from a few steppe reserves in the east of the country, grassland habitats were barely covered by protected areas. Developing new grassland sites was particularly pleasing for many of us, as several authors of the new Emerald sites are members of the EDGG.

1.6 million hectares of new territory have now been added to the Emerald Network (Fig. 1). Emerald sites that were officially recognised in December are exclusively natural territories and took the numbering from UA0000271 to UA0000377. In most cases, they are river valleys, steppe valleys and valuable forest areas in different regions of Ukraine. The great majority of these sites were not previously protected, and all of them are important for rare species and natural habitats in Europe. It is very important that many types of steppe habitats are protected in Ukraine because very few countries that are parties to the Berne Convention have true steppes. Furthermore, habitat types E1.13 Continental dry rocky steppe grasslands and dwarf scrub on chalk outcrops; G3.4G Pinus sylvestris forest on chalk in the steppe zone; and X36 Depressions (pody) of the steppe zone were included in Resolution 4 at the request of Ukraine (Council of Europe 2019b), as these habitat types are absent in other European countries, except for the Russian Federation. It is important to note that seven sites were created specifically to conserve X36 habitats. In total, almost half of the areas included in the Ukrainian part of the Emerald Network in 2019 are represented by grassland habitat types.

The largest of the newly designated sites are important for the implementation of recent Convention decisions. For example, the Aidar river valley site (UA0000313, 117,237 ha) includes Ukraine’s most extensive areas of habitat types E1.13 and G3.4G. Similarly, the Kerch peninsula site (UA0000377, 231,364 ha) is almost completely covered by E1.2 and includes autochthonous mud volcanoes that are included in H6 - Recent volcanic features - from the 2018 revision of the scope and definition of this habitat type that was also suggested by Ukraine.

**Outlook**

Importantly, the designation of these 106 Emerald sites is only the start of expanding the Emerald network in Ukraine. Work is currently underway to prepare the next proposal, covering another 2 million hectares, of which the grasslands occupy at least half of the area. Among them, the most notable is the complex of sites in the Luhansk region (eastern Ukraine), covering a total of 400,000 ha of rocky steppes along the Donets Ridge.

**Author contributions**

A.K. and O.V. jointly developed the publication structure and drafted the manuscript. O.M. prepared data on the presence of different grassland habitat types in the newly adopted Emerald sites, while G.K. calculated the total area of grassland habitats in the newly adopted Emerald sites. All authors critically revised the manuscript.

**Acknowledgments**

We are sincerely grateful to Anastasia Drapalyuk from the Ministry of Energy and Environmental Protection of Ukraine, without whose efforts our work would not have reached its successful conclusion. In addition, we thank Maxym Marushchak for preparing the material for this publication.
